Data management for an industrial client

Background

The application is an online tool for the client to fetch details for a given product.

	Custom Development
	PHP
	Content Management
	Database
	CSS
	HTML
	JavaScript

The Challenge

The client has over 50000 different products, which are being maintained in an Oracle database in their datacenter. The challenge was to get the data online without disturbing their existing setup.

The Solution

NRS designed a solution which would enable them to update their online database from the existing local Oracle database, without compromising any security. The online data was very well organized and arranged so that it was easy to get to a product with just few clicks.

Major Features

- 6 different types of search/filter processes to get the desired result quickly
- Ability to handle updates multiple times during the day
- Very user friendly administration panel

Some other Features

- Well organized data structure
- Enable / disable products
- Multiple images per product
- Ability to have datasheets for all the products
